

JOIN (Action)		
START	CHANGE	RESULT
Jimmy has 5 balloons.	Sally gives Jimmy 3 more balloons.	Jimmy has 8 balloons.
		
There is an amount you “begin” with.	That amount is <i>increased</i> because you ADD something to it.	There is a final amount that you “end” with.
<p>Remember!</p> <ul style="list-style-type: none"> <li>Join problems involve an action that increases a “starting” quantity by adding something to it. The result will be greater than the start.</li> <li>The change occurs over time.</li> </ul>		

SEPARATE (Action)		
START	CHANGE	RESULT
Jimmy has 5 balloons.	Jimmy pops 2 of his balloons.	Jimmy has 3 balloons.
		
There is an amount you “begin” with.	That amount is <i>decreased</i> because you REMOVE something from it.	There is a final amount that you “end” with.
<p>Remember!</p> <ul style="list-style-type: none"> <li>Separate problems involve an action that decreases a “starting” quantity by removing something from it. The result will be lesser than the start.</li> <li>The change occurs over time.</li> </ul>		

## PART-PART-WHOLE (Relationship)

PART	PART	WHOLE
Jimmy has 2 red balloons.	Jimmy also has 3 yellow balloons.	Jimmy has 5 total balloons.
		
There is an amount that is a part (or a “subset”) of the whole.	There is another amount that is a part (or a “subset”) of the whole.	There is an amount that is the complete “set” or “collection”.

Remember!

- Part-Part-Whole problems **do not** use action words.
- Instead, there is a relationship between the whole and its parts.
- There are two types of PPW problems:
  - Both parts are given, and we need to find the size of the whole.
  - We are given the size of one part and the size of the whole, and need to find a missing part.

## COMPARE (Relationship)

GREATER	DIFFERENCE	LESSER
Jimmy has 5 balloons.	Jimmy has 2 more balloons than Sally does.	Sally has 3 balloons.
	<div style="display: flex; justify-content: space-around;"> <div style="text-align: center;"> <p><b>Jimmy</b></p>  </div> <div style="text-align: center;"> <p><b>Sally</b></p>  </div> </div>	
There is a set. This set is greater or “bigger” than the other set.	This amount describes how the 2 sets compare to each other. This amount says <i>how much greater</i> the greater set is than the lesser set.	There is a <b>separate</b> set. This set is lesser or “smaller” than the other set.

Remember!

- Compare problems involve a comparison of two different sets.
- Compare problems **do not** involve action.
- There are three types of compare problems, depending on which quantity is *unknown*:
  - The difference (the quantity by which the larger set exceeds the smaller set)
  - The quantity in the greater set
  - The quantity in the lesser set

## EQUAL GROUPS (Relationship)

GROUP	SIZE	TOTAL
Jimmy buys 2 packs of balloons.	Each pack contains 5 balloons.	Jimmy has 10 total balloons.
		
This is the number of equal sized groups.	This is the amount in each group.	This is the number or amount in ALL groups.

**Remember!**

- One factor tells the amount in each group and the other factor tells the number of equal-size groups.
- The product tells the total amount in ALL groups.
- Equal groups story problems include:
  - When the number of groups and the amount in each group are known in an equal groups situation, the unknown value is the total.
  - When the total is known in an equal groups situation, the unknown value is the number of groups or the amount in each group.

## MULTIPLICATIVE COMPARE (Relationship)

GREATER	TIMES	LESSER
Jimmy has 8 balloons.	Jimmy has 4 times as many balloons as Sally.	Sally has 2 balloons.
	<p><b>Sally's Balloons x 4 = 8</b> <b>(Jimmy's Balloons)</b></p>	
There is a set. This set is greater or "bigger" than the other set.	This amount describes how the 2 sets compare to each other. This amount says <i>how many times greater</i> the greater set is than the lesser set.	There is a <b>separate</b> set. This set is lesser or "smaller" than the other set.

**Remember!**

- Multiplicative comparison problems are when we are given the quantities in a set, or a comparison factor.
- Either the amount in a set, or the comparison factor will be missing.
- Depending on the missing piece, either multiplication or division will be used to solve.
